# ACEP Policy Statement

**EMERGENCY ULTRASOUND GUIDELINES 2008**

Emergency ultrasound can be classified into the following functional clinical categories:

1. *Resuscitative*: ultrasound use as directly related to an acute resuscitation
2. *Diagnostic*: ultrasound utilized in an emergent diagnostic imaging capacity
3. *Symptom or sign-based*: ultrasound used in a clinical pathway based upon the patient's symptom or sign (eg, shortness of breath)
4. *Procedure guidance*: ultrasound used as an aid to guide a procedure
5. *Therapeutic and Monitoring*: ultrasound use in therapeutics or in physiological monitoring

# The big questions…

- ❑ Is there cardiac activity ?
- ❑ Is there a cardiac tamponade?
- ❑ What is the overall profile of the heart kinetic?
- ❑ How is the LV function?
- ❑ Is there a picture suggestive for acute pulmonary heart?
- ❑ What is the profile of IVC?
- ❑ Have the lungs a profile "dry" or "wet"?
- ❑ Is there a PNX?

# The resuscitation team leader

**Clinical question.**

**ALS-CPR&A-003B "In adult in cardiac arrest (pre-hospital [OHCA], in-hospital [IHCA]) (P), does the use of ultrasound (including trans-thoracic and trans-esophageal echocardiography) during cardiac arrest (I) compared with standard CPR (C), improve any outcomes (eg. ROSC, survival) (O)"**

**Is this question addressing an intervention/therapy, prognosis or diagnosis?** intervention

**State if this is a proposed new topic or revision of existing worksheet:** new topic

**Search strategy (including electronic databases searched).**

- EMBASE -- "Ultrasound" OR "Echocardiography" AND "Cardiac Resuscitation" OR "ACLS" OR "CPR" OR "Cardiac Arrest"
- Pubmed – "Echocardiography"(Mesh) OR "Echocardiography, Trans-esophageal" (Mesh) OR "Ultrasonography" (Mesh) AND "Cardiopulmonary Resuscitation" (Mesh) OR "Advanced Cardiac Life Support" (Mesh) OR "Death, Sudden, Cardiac" (Mesh). Also searched for "Related Articles" to each article that appeared relevant.
- Cochrane -- "Echocardiography"(Mesh) OR "Echocardiography, Trans-esophageal" (Mesh) OR "Ultrasonography" (Mesh) AND "Cardiopulmonary Resuscitation" (Mesh) OR "Advanced Cardiac Life Support" (Mesh) OR "Death, Sudden, Cardiac" (Mesh).
- Hand search of references of all relevant articles
- Last search: September 2009 yielded 47 papers

- **State inclusion and exclusion criteria**

Exclusion criteria – not relevant studies, animal studies, reviews, case reports, letters

Inclusion criteria – We searched for all peer-reviewed studies that described the use of ultrasound in cardiac arrest.

**REVIEWER'S FINAL COMMENTS AND ASSESSMENT OF BENEFIT / RISK:**

Ultrasound has been utilized for diagnostic and procedural guidance at the bedside of the critically ill patient for nearly 3 decades. Unfortunately, few studies have looked at its specific role in guiding the resuscitation of the patient in cardiac arrest. Instead, the research focuses on three primary areas:

1. The use of ultrasound to diagnose treatable causes of cardiac arrest and the prevalence of these conditions (eg. pneumothorax, pericardial effusion, volume depletion, pulmonary embolus). The bulk of studies, however, look at patients who are not in cardiac arrest.
2. The use of ultrasound to guide procedures which maybe performed in the patient in cardiac arrest (eg. central line placement, pericardiocentesis, transvenous pacer placement). Again, the vast majority of studies looking at the use of ultrasound for procedural guidance are done in patients who are not in cardiac arrest.
3. Ultrasound determination of cardiac standstill as an indication to terminate resuscitative efforts. Although these studies are performed in patients in cardiac arrest, the benefits of ultrasound are largely related to decreased resource use and emergency department patient flow, NOT improved patient outcomes.

Although there is great potential for the use of ultrasound to benefit the patient in cardiac arrest, there are no studies confirming improved outcomes at this time. Future research questions might include: Does ultrasound detection of

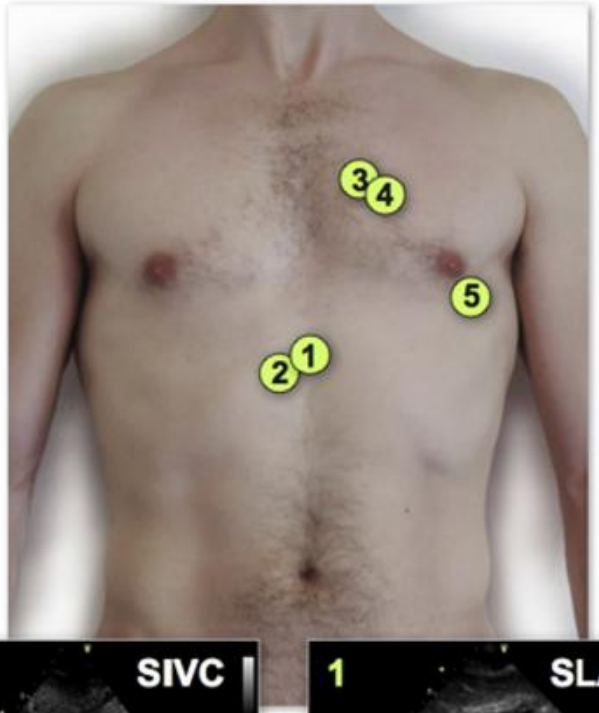
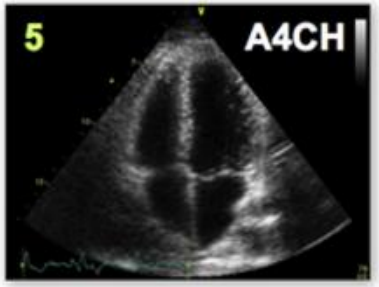
# FoCUS





*For patients in cardiac arrest, the subcostal view may be attempted first. If not sufficient to image the heart, the apical four-chamber view or parasternal long-axis view may be attempted next, as long as conforming to ALS protocol. It is recommended that FoCUS examination images and videos be stored.*

34. *In the setting of cardiac arrest, FoCUS is more accurate than electrocardiography for determining mechanical cardiac function.*

[1A: Strong Recommendation, with Very Good Agreement; Level A Evidence]

35. *In the setting of cardiac arrest, FoCUS changes management.*

[1A: Strong Recommendation, with Very Good Agreement; Level A Evidence]

38. *In the setting of cardiac arrest, FoCUS is more accurate than the physical examination for diagnosing the cause of cardiac arrest.*

[1B: Strong Recommendation, with Good Agreement; Level B Evidence]

39. *In the setting of cardiac arrest, FoCUS is more accurate than the physical examination for assessing cardiac function.*

[1A: Strong Recommendation, with Very Good Agreement; Level A Evidence]

*37. In the setting of cardiac arrest, FoCUS improves outcome.*

[NO Recommendation, NO Agreement; Level C Evidence]

# Ultrasound During Cardiac Arrest

| --- | --- |
| Ultrasound (cardiac or noncardiac) may be considered during the management of cardiac arrest, although its usefulness has not been well established | Class IIb, LOE C-EO |

# Ultrasound During Cardiac Arrest

| 2015 Recommendations—Updated | Class |
| --- | --- |
| If a qualified sonographer is present and use of ultrasound does not interfere with the standard cardiac arrest treatment protocol, then ultrasound may be considered as an adjunct to standard patient evaluation | IIb, LOE C-EO |

American Heart Association. American Stroke Association.

International Liaison Committee on Resuscitation ILCOR

# CONCLUSIONS

1. US is helpful in identification or exclusion of some reversible causes of cardiac arrest & shock (hypovolemia, cardiac tamponade, pneumothorax , pulmonary embolism, …)
2. US should be integrated in ALS algorithm
3. Potential US role in diagnosis / prognosis of cardiac arrest but not enough scientific evidences on outcome
